CUSTOMER COMMITMENT

Successful equipment operation requires the Owner to be responsible for the operation, as well as for safety and maintenance. When applicable, operational items are addressed to the highest level possible by the dealer and Bourgault. However, some functional items are best verified in the field and therefore it is ultimately the Owner's responsibility to ensure that operational items are verified at start up and at appropriate time intervals.

WARRANTY REGISTRATION

Bourgault Australia Pty Ltd. PO Box 1063. KELMSCOTT. WA 6997

Below is a basic operational checklist to be used to identify potential seeding system issues:

- Ensure the product is being delivered to the correct seed and fertilizer opener outlets – specifically;
 - The secondary manifolds are connected to the correct primary manifold port
 - Seed is directed to seed openers and fertilizer to fertilizer openers.
- When equipped with auto section control (ASC), verify the following critical items;
 - The ASC system physically shuts-off the same location on the drill as the location indicated on the monitor
 - The ASC on and off timings is verified, failure to do so may result in misses and/or overlap
 - The ASC Control Mode (% of overlap per section) is field tested, failure to do so may result in misses and/or overlap.
- Verify the depth of all seed openers and all fertilizer openers are checked and set to provide proper product placement (whenever packing force and/or soil conditions change).
- Ensure the packing force is set to deliver appropriate levels of seed to soil contact and soil compaction.
- Verify that operation speed is monitored. (Excessive soil movement (stepping) will result if excessive ground speed occurs for the given; soil conditions, seed and fertilizer opener selection and depth).
- Verify calibration of the air-seeder is properly performed to ensure accurate application rates are achieved for each of the products being applied.
- Ensure fan speed(s) are correctly set by;
 - Closely following the fan speed setting procedure and referencing the appropriate charts, and
 - Achieving cleanout time of less than 4 seconds.

Note: Failure to correctly set fan speed may result in uneven distribution, plugging and/or premature hose wear.
- Make certain that the air seeder tank pressurizes properly and is free of air leaks.
- When equipped with a liquid application system verify;
 - The system is properly configured to achieve the desired range of target rates.
 - The liquid filters, manifolds, distribution hoses and nozzles (where fitted) are operating at the correct system pressure, free from leaks, restrictions and damage.
 - The liquid tank is sealed, the breather tube unrestricted and the overflow management valve (where fitted) is open during fill and closed during use.
 - The unit is thoroughly flushed before wing-fold, transport and storage.
 - It is also understood that liquid fertiliser, when left in direct contact with equipment will result in corrosion.

As the Owner, I assume all responsibility for any performance related issues as a result of not adhering to the items listed above (where applicable) or not adhering to other procedures considered inherent for basic equipment operation as outlined in the operator's manual.
