Yen Sun Technology Corporation was established in 1987, conforming with the business philosophies of **INNOVATION, QUALITY** and **EFFICIENCY**.

With over 1000 employees, Yen Sun is a publicly-traded company in Taiwan comprised of two major divisions, including the Electronics Cooling Division and the Home Appliances Division. The manufacturing plants are located in Taiwan, Dongguan, and Shanghai with worldwide service facilities throughout Asia, America, Australia and the greater part of Europe.

In the past decade, the Electronic Cooling Division has accumulated hundreds of patents all over the world and successfully established a reputation of consistent quality and unique capabilities with its well-known brand name Y.S. TECH.

Devoted to innovative technologies and new products, Y.S. TECH continuously improves its R&D and core technologies. The core technologies consist of Advanced Motor Control, CFD Thermal and Fluid Dynamic Simulation, Psycho-Acoustic Analysis, and Electro-Thermal Analysis. Y.S. TECH has integrated its core technologies to develop a series of DC and AC cooling fans with RoHS compliance such as a series of Xtreme high performance fans, along with the SINTETICO long life bearing system that has been approved for Telecom and Automotive applications. Furthermore, utilizing T.M.D. Technology Y.S. TECH has developed the world's slimmest fans measuring only 0.4 centimeters in thickness with applications including the next-generation multi-function handheld devices.

CUSTOMER SATISFACTION is based on excellent production capabilities as well as a consistent level of quality. In such a way, Y.S. TECH's advanced automated production lines, along with our precision equipment, provide a high level quality control. Moreover, Yen Sun utilizes XRF to assist its Environmental Materials Management.

This quality system has not only been approved by ISO 14001 and ISO 9001, but has also gained TS 16949 certification, the worldwide automotive industry quality standard.

At Y.S. TECH, our long-term vision is to aggressively integrate our business resources, enhance total quality management, innovations, and increase our global logistics capabilities to achieve competitive advantages as a world-class manufacturer to be **YOUR BEST PARTNER OF THERMAL SOLUTIONS**.

Automotive Applications

Y.S. TECH has many years of experience working in both the North American and European Automotive Markets. Utilizing our core technologies of CFD simulations, Psycho-Acoustic Analysis, Multi-function control system, mechanical expertise, and overall system integration we are able to develop optimal cooling solutions for customers in one of many different applications. Telematics Systems(Navigation, Audio Amplifiers, DVD and Head units), Seat heating and cooling, Hybrid Driving System (Fuel Cell-Gasoline), LED lighting and more are just a few of the applications Y.S. TECH can help solve thermal management problems. Our goal is to provide a cooling system that is unsurpassed in reliability, quality and performance giving the driver & passengers the most comfortable driving experience.

Advantages

- TS16949 CERTIFICATED
- Wide range operating voltage 4 ~ 16VDC at 12V Rated
- Wide range operating temperature:-40 ~ 90
- Multi-Function motor control
 - Thermostat control(NTC)
 - Pulse Width Modulation control(PWM)
 - PWM with NTC hybrid control
- Redundancy protection design
- Customized design by program
- High Reliability
 - Over-Voltage Resistance during long term operation: DC 27V / 1 min
 - Thermal Shock: -40 ~ 90, 1hr per Temp., Temp. Change in 30 sec.
 - Mechanical Shock: Semi-wave, $a = 500m/s^2$, 6ms, 10 times per direction
 - Vibration Test: 5Hz/0.00919 G2/Hz ~ 2000Hz/0.00146 G2/Hz, 25/12hrs
- Customized design service for total thermal solutions and analysis

T Telecommunication Applications

Y.S. TECH has applied our expertise in fan design to produce a line of high output fans well suited for Telecom applications(System Chassis, Fast Ethernet Switch, Service Gateway, VoIP Product, Network Storage System(NAS) and Server system). Serving the Telecom markets of Asia, Europe, and North America we have a broad understanding of the needs of our global market. Y.S. TECH's Xtreme Series is a line of fans that have been designed with a unique flow pattern that has overcomes the low pressure boundaries that traditional axial fans have. The stationary and dual rotor products made by Y.S. TECH have high torque motors, more robust bearing systems and internal motor structure that will provide the high end performance and reliability for applications with high impedance. Sound quality is always a concern too and we can offer many options to better manage and achieve those goals.

Advantages

- High operating voltage:
 - Max. operating voltage 75VDC for 48VDC rated.
 - Max. operating voltage 40VDC for 24VDC rated.
- High Vcc input for control signal design by open collector circuit.
- Multi-Function motor control
 - Thermostat control(NTC)
 - Pulse Width Modulation control(PWM)
 - PWM with NTC hybrid control
 - Customized design by program
- Reversed Blade design for more reliability (To ensure fan running on a right direction and improve life, especially for chassis cooling application.)
- Water/Dust Proof
- Customized Fan-Tray design and CFD analysis service (To reduce consonance, vibration, and reversed electromotive force.)
- High quality and reliability
 - Surge voltage & overload current protection
 - Redundancy protection design
 - Soft Start up & Hot Swappable support
 - Sustained rotating system and mechanical design
- Customized design service for total thermal solutions and analysis

Normally most users select cooling fans or blowers by referring to the maximum flow rates, pressure and rotational speed in the specification. However you have to have a good understanding of the system resistance and flow patterns inside the application. YS TECH highly recommends identifying the operating point in the application and cross reference that data with the performance curve of the fan to know exactly what is to be expected from the fan in the system. Other design elements to be sensitive of are power consumption and acoustic performance in the application. All of these factors will effect the others based on the total system requirements. You will have to weigh which are more import to achieve your end results. The following will help guide you through the design and select the right fan. Following this section we will review other key topics including L10, ROHS and additional application notes.

STEP 1:

Ask five questions before choosing a fan

Here are five questions of thermal inquiry we need to verify at first. That include:

1.Watt:

How many watts would you need to dissipate?

2.Air Impedance:

What is your system air-impedance?

3.Noise:

What is acoustic noise specification you need?

4.Temperature Gradient:

What is your design of ΔT ?

5.Dimension:

What is fan dimension you need?

STEP 2:

Choose the right fan or blower to meet your thermal needs.

The effects of heat transfer include conduction, convection, and radiation. Most heat transferred by conduction and/or radiation effect the total system mechanism. For example, a good chassis or heat sink design is much more effective in accomplishing your goals. Convection cooling happens in 2 ways; natural and forced air. Cooling fans and blowers are the driver behind forced convection cooling and always increases the effectiveness of the system cooling. Illustration 1 shows you a normal system using heat dissipation via natural convection. $P_{con\&rad}$ presents heat dissipation of natural convection and radiation transfer. P_{fan} presents forced convection that needs a cooling fan or blower to assist with dissipation, $\Delta T = T_2 - T_1$. T_2 is the thermal spec of the critical parts within margin tolerance. T_1 presents ambient temperature.

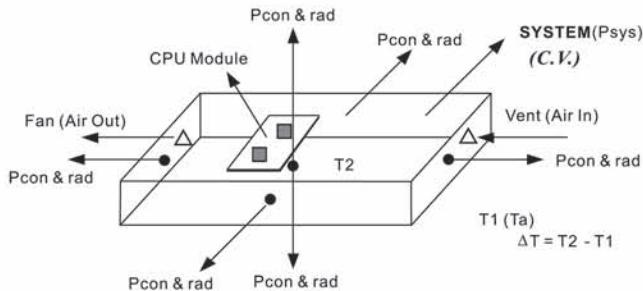

Illustration 1: System Heat transferred

Now we can estimate the flow rates with the following equations:

$$P_{fan} = P_{sys} - P_{con\&rad}$$

$$P_{fan} = C_p \times Q \times \rho \times \Delta T$$

$$Q_{eff}(CFM) = \frac{P_{fan}}{C_p \times \rho \times \Delta T} = \frac{1.76 \times P_{fan}}{\Delta T_e} = \frac{3.16 \times P_{fan}}{\Delta T_f}$$

Q_{eff} : Efficiency Flow Rate

ρ : Gas Density

C_p : Specific Heat of Gas

$Q_{eff} = 3160 \times KW / \Delta T_f$

ΔT_f : Allowable temperature rise in degree Fahrenheit

ΔT_e : Allowable temperature rise in degree Celsius

By incorporating conversion factors, specific heat and density of sea level air we can summarize above equations of Q_{eff} that is called the effective flow rate. The fans operating point should be equal to or greater than Q_{eff} . The fans operating point is the point at which the performance curve and system impedance curve intersect. This factor can vary based on component placement in and density of the application. Normally this is measured by static pressure, fPi . Please reference the following formula:

$$\Delta Pi = kQ^n$$

k : System form factor constant value.

Q : Flow rate by different impedance

n : Coefficient of turbulence

$1 < n < 2$. Laminar Flow, $n = 1$; Turbulence Flow, $n = 2$

Illustration 2 shows two fans performance curve and system air impedance curve.

Even B's maximum flow rate is higher than A's but the Q_{op_A} better than Q_{op_B} . Both Q_{op_A} and Q_{op_B} are Operating Points.

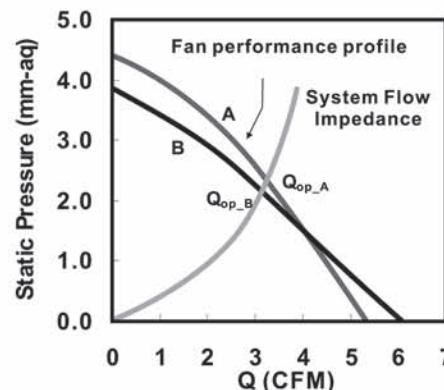

Illustration 2: Fan Performance Comparison

If $Q_{op_B} < Q_{eff} < Q_{op_A}$,

Then we can say Fan A is a proper choice for this thermal solution. So that why we emphasize that focus on fan performance profile rather than on maximum flow rate or static pressure or rotational speed.

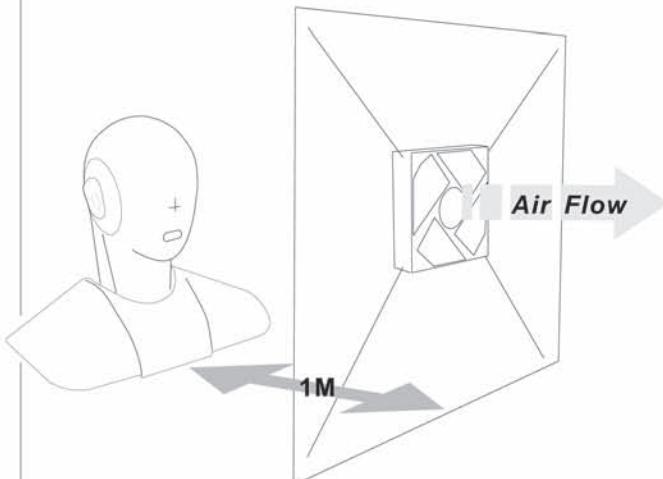

STEP 3:***Choose a solution with low noise***

As mentioned before the flow rate, static pressure and acoustic noise are a trade off. You have to balance these key elements in your design. Meanwhile many issues can arise if the fans are misapplied in the system. For example, mounting fans directly on the chassis can resonate vibration throughout the chassis and greatly increase the audible noise. Please reference the following notes to optimize your system for the best all around sound quality:

1. Efficient design for system impedance. Higher system air impedance needs a higher pressure fan, but that comes with higher noise. Allow enough space for your critical components to have maximum flow patterns around them. We recommend you measure your system air impedance and collect enough data to know your fPi. Normally, a specialized fan manufacturer can help you with this process.
2. Choose a proper fan based on the Qeff. We have illustrated to you a method to figure out the right fan for Qeff, now consider the current and acoustic noise. Which one is the first priority? YS TECH recommends to evaluate the two parameters under the same Qeff.
3. Review the mechanical design between the fan and system. Vibration and flow disturbance always causes resonance and greater acoustic noise. Proper mounting and flow field design may decrease noise. For example, mounting a fan with a rubber boot will definitely reduce resonance in the chassis. Review your design and make sure there is enough margin (over 1.5mm) at the intake/exhaust of the fan. If there are odd shapes blocking the airflow that will add to the audible noise.
4. Advanced fan speed control via your thermal profile. The thermal profile of a system is similar to a fan performance curve. The system can be designed to utilize the fan only at the needed speed to gain the thermal dissipation needed, not more. The control of the fan in the system will better manage the used power, thermal dissipation and acoustics. The most popular way of achieving this is use PWM control or we can also provide fans with integrated thermistors.
5. Sound quality analysis. In the cooling fan industry we have always focused on the sound pressure, but with the increased speeds available today the total system noise in application can get very high. This has pushed industry standards to put limits on system noise. Designing with this in mind we have to keep in mind how sound quality is perceived by the human ear so that we can offer the best solutions. Our primary interest is to create the best overall sound quality. The examination methods are based on the idea of correct recording and description of the noise exposure from the acoustic environment in a way that reflects what humans subjectively perceive.

In order to record this entire perception, physical aspects as well as psychoacoustic characteristics of hearing and cognitive aspects must be considered. The main focus of psychoacoustics is the subject aural perception by human beings. The goal is objectively describing the subjective perception. YS TECH introduced the sound quality analysis system from HEAD ACOUSTICS out of Germany. This system includes artificial head and analysis tools that are utilized in the automotive industries for measuring all types of acoustics parameters. We also have the capability to provide detailed data about: Sound pressure levels, Sone, Tonality, and Modulation.

1. ANECHOIC Room Noise Measurement System.
2. Digital Head Measurement System, 16-bits version.
3. SQLab III, Mobile Multi-channel Analysis System.
4. Specifications: ISO 3744, ISO 3745, ISO 7779, CNS 6753, JIS 8346
5. Background Noise: < 17dB(A)

Cooling Fan Life Expectancy: L₁₀ and MTTF

Fan reliability can be evaluated in several ways. The data for a life test can be plotted as a cumulative distribution that shows the total fraction of fans failing up to any operating time. Fig. 1 is a sample of cumulative distribution, which was stopped at 8,400 hours after 18 out of 48 fans had failed.

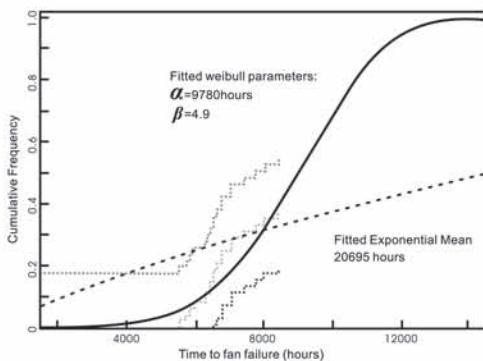

Figure 1 : Sample cumulative distribution function, Weibull vs. Empirical with 95% confidence bands
(Reference : IBM Corp., May 1996, Vol.2, No.2, Electronics Cooling)

Some vendors provide life expectancy data to customers based on the exponential assumption. However, life test data does not support the use of the exponential distribution. Nevertheless the past experimentation fitting has shown that the Weibull distribution provides a good fit to real fan life data. The *Cumulative Distribution Function*, $F(t)$ of Weibull distribution is a below:

$$F(t) = 1 - e^{-(t/\alpha)^\beta}$$

Where t : age

α : characteristic life (Scale Parameter)
 β : shape parameter

Then Reliability Function is $R(t) = e^{-(t/\alpha)^\beta}$

$$MTTF = \int_0^{\infty} R(t) dt = \alpha \Gamma(1 + 1/\beta) \quad \Gamma : \text{Gamma Function}$$

Normally, L_{10} was introduced a life expectancy parameters by fan vendors. That means the tenth percentiles under an assumed life distribution such as the Weibull. Sometimes vendors will also quote the Mean Time To Failure (MTTF) then we need to figure out the correlation between L_{10} and MTTF by following equations:

$\because L_{10}$ Means age t when $F(t)=0.1$

$$\therefore 0.1 = 1 - e^{-(L_{10}/\alpha)^\beta}$$

$$L_{10} = \alpha (0.10536)^{1/\beta}$$

$$MTTF = 7.46 \times L_{10} \approx 7 \times L_{10} \quad (90\% \text{ Confidence Level})$$

After we have verified the correlation between L_{10} and MTTF, we also need to know how long should a sample size be tested to determine with 90% confidence level that L_{10} greater than or equal to expectancy value at a test temperature without failure ($x = 0$). Here we introduce the Poisson Distribution to estimate.

$$P(x, t) = \{(\lambda t)^x e^{-\lambda t} \} / x!$$

$$P(0, t) = \{(\lambda t)^0 e^{-\lambda t} \} / 0! = e^{-\lambda t}$$

$$\therefore R(t) = e^{-(t/\alpha)^\beta}$$

$$MTTF = \alpha \Gamma(1 + 1/\beta)$$

$$\therefore t = \alpha [(Br : c)/n]^{1/\beta}$$

$$t = [MTTF / \Gamma(1 + 1/\beta)] \times [(B_{rc}/n)]^{1/\beta}$$

where B_{rc} is Poisson Distribution Factor

Normally on the condition of 90% confidence level and 0 failure then $B_{rc} = 2.303$.

Then we introduce *Takes Martin Marietta Model* to estimate Life at different environment stress.

$$AF = [Va / Vu] \times 2^{(Ta - Tu)/10}$$

where

AF : Acceleration Factor

Va : Actual Testing Voltage

Vu : Rating Voltage

Ta : Actual Testing Temperature

Tu : Rating Temperature

if $Va = Vu$

then $AF(t) = 2^{(Ta - Tu)/10}$

Then we can define the *Required Test Time* (t) with zero failure is as below:

$$t = [MTTF / \Gamma(1 + 1/\beta)] \times [(B_{rc}/n)]^{1/\beta} / 2^{(Ta - Tu)/10}$$

where MTTF is an expectancy value

Management Regulations for the Environment-Related Substances

Management Standards

SUBSTANCES	Allowable Content (ppm)	
	RoHS	SONY SS259
Cadmium and Cadmium compounds	<100	0
Lead and Lead compounds	<1000	<100
Total concentration of four heavy metals for product package (Concentration of Cadmium for Plastics (including Rubber) has to less than 5 ppm.)	<1000	<100

Note:

1. For RoHS, Decabromobiphenyl ether (DecaBDE) in polymeric applications is exempted by Commission Decision of 13 Oct. 2005 amending Directive 2002/95/EC notified under document 2005/717/EC.
2. PBBEs=PBDEs=Polybrominated Diphenyl Ethers=PBDos=PBBos.

Standards for Preconditioning and Measurement

I. Pre-conditioning

- Typical pre-conditioning methods are as follows:
1. Incineration under the existence of sulfuric acid.
 2. A pressurized acid decomposition method done in a sealed container. (A microwave decomposition method such as EN 13346:2000 and EPA 3052:1996)
 3. An acid decomposition method under the existence of sulfuric acid or hydrogen-peroxide water. (e.g. EPA3050B Rev.2: 1996).
 4. A wet decomposition method under the existence of sulfuric acid, nitric acid, or hydrogen-peroxide water. (e.g. BS EN 1122:2001)
 5. If precipitates (insoluble matter) are produced, dissolve them totally by taking some means. (e.g. alkali dissolution)
 6. US EPA 3540C or 3550 for organic or organic compounds substances.

II. Measurement methods

- Typical measurement methods are as follows,
1. Inductively Coupled-Plasma-Atomic (Optical) Emission Spectroscopy (ICP-AES, ICP-OES) (e.g. EN ISO 11885:1998)
 2. Atomic Absorption Spectroscopy (AAS) (e.g. EN ISO5961: 1995).
 3. Inductively Coupled-Plasma Mass Spectroscopy (ICP-MS)
 4. Gas Chromatography Mass Spectroscopy (GC-M S) for organic or organic compounds substances.
 5. If a combination of a pre-conditioning method and a measurement method can guarantee that the lower determination limit of cadmium is less than 5 ppm, the combination is also applicable.
 6. Any one of the measurement methods above (except AAS) enables you to analyze cadmium and lead simultaneously.

III. Environmental Logo

Environmental Concern & Keep Improving

Cooling Fan and Blower Application Notices

Test Conditions and definitions

Most specifications of cooling fan are measured after 5 minutes rotating in an ambient of 25°C/ 65% RH. The operating voltage and temperature were defined after fan rotating continually at rated voltage. Starting Voltage was defined on power on/off condition and Rotational Speed was defined on full speed by its rated value. Except for the feature of the Lock Rotor Protection specifically stated, Y.S. Tech highly suggests not to stop the impellers of the working fans such interruption will cause adverse effect. Noise Level is different from abnormal noise. We estimate noise level by equation when noise level is lower than background noise (17dB). L10 of Life test is a deductive value under statistical method and it is different from product warranty.

Handling

Please be cautious when fan is being exercised or handled. Applying pressure to the impeller, handling the fan by lead wire, or dropping the fans to the production platform is resulting in damage.

Fan is to be stored in a dry/cool place. High levels of humidity are harmful to products. If fan was stocked at an ambient temperature under 5°C and over 24 hrs. Please stock fans to an ambient temperature over 20°C and remained over 24 hrs before using. All specifications include abnormal noise have to be measured after 30 minute running.

The correct polarity, Positive (+) and Negative (-), has to be clearly identified before connecting the fan to the power. Be aware of the connection with reverse polarity may lead to damage since no effective protection can be introduced against such errors.

With exception of suitability of some particular designs, any failure and problems regarding safety of the product caused by the introduction of powder, droplets of water or encroachment of insert in the hub are not guaranteed. It is also not well suited for corrosive environments that include liquids, gases, or matters.

After Service

A written request should be submitted to Y.S. Tech prior to approval if abnormality and deviation from specification is required. Meanwhile, send abnormal samples to Y.S. TECH for more detail analysis is necessary.

Other Reminding

Please be cautious. Y.S. Tech is not responsible for any excess resonance, vibration and subsequent noise caused by incorrect mounting of fans. Take necessary precaution handling fans when in operation. Finger guards are recommended to prevent personal injury. To avoid any unstable power, an "over 4.7°F" capacitor has to be connected to fan externally whenever multiple fans are applied in parallel.

IV. Acoustic Noise

$$\text{Sound Pressure Level (SPL, dB)} = 20 \log (P/P_0)$$

where $P_0 = 20 \mu P_a$

P_a : the reference sound pressure of human hearing system

Similarity Algorithm of Acoustic Noise

ii) By Rotational Speed (rpm)

$$N_2 = N_1 + 50 \log (rpm_2 / rpm_1)$$

where

N_1 = Noise level measured at rpm₁

N_2 = Noise level calculated at rpm₂

i) By Measuring Distance

$$N_2 = N_1 + 20 \log (Distance_1 / Distance_2)$$

where

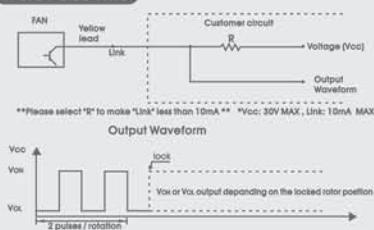

N_1 = Noise level measured at Distance₁

N_2 = Noise level calculated at Distance₂

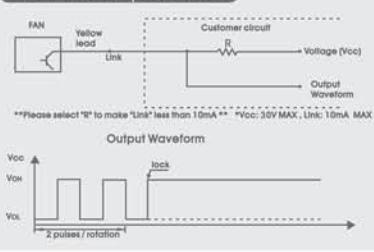

According to above equations, it is very clear the acoustic noise level will reduce 6 dB when the distance doubled. Comparatively, the noise level will also increase 6 dB when distance shorten by half.

Wave form of ic function

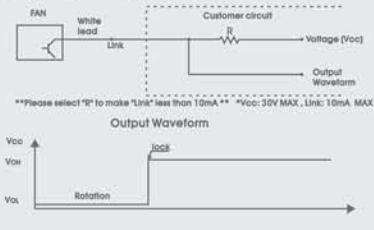

1. 3rd Pulse Wire

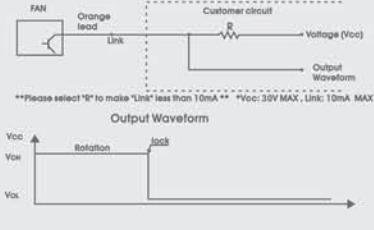

5. Tachometer Speed Sensor

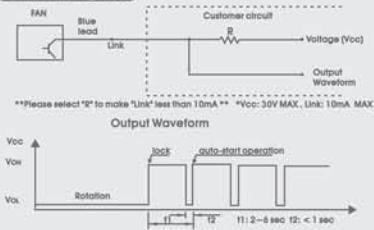

4. Alarm / high

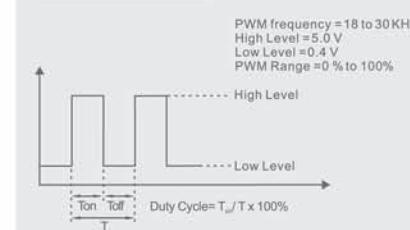

3. Alarm / low

2. Alarm / high low

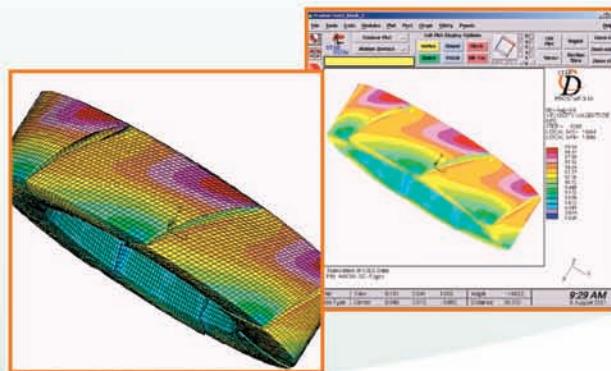

W:PWM Control Input

Y.S. TECH's advance R&D Center utilizes various most advance analysis/simulation software and labs while designing different impellers, thermal modules for any particular cooling devices. This Integrated Supporting System of thermal solutions enables engineers and designers to stimulate a micro climate and then optimize the performance for more Green, Silent and Powerful cooling devices.

Facilities For Supporting Design

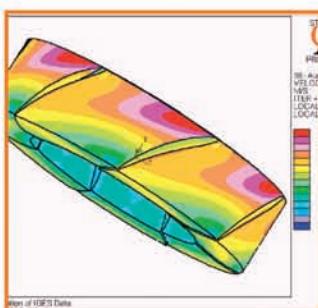

■ CFD Software-Star-CD

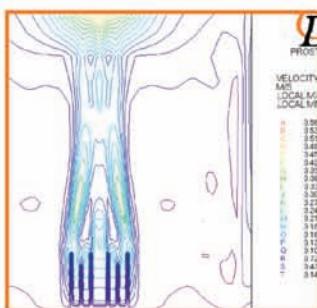

To visualize temperature distribution of observed object surface

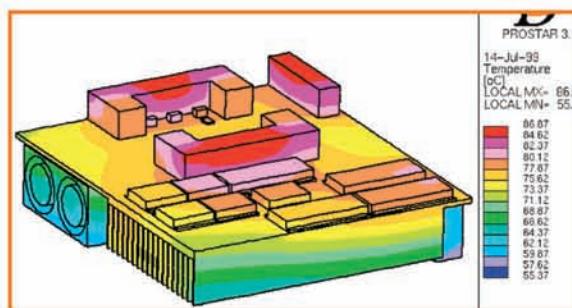

Fan, Ventilation and Thermal System Design

■ Airflow Velocity Distribution of Fan

■ Airflow Velocity Distribution of Heat Sink

■ Temperature Distribution of Thermal System

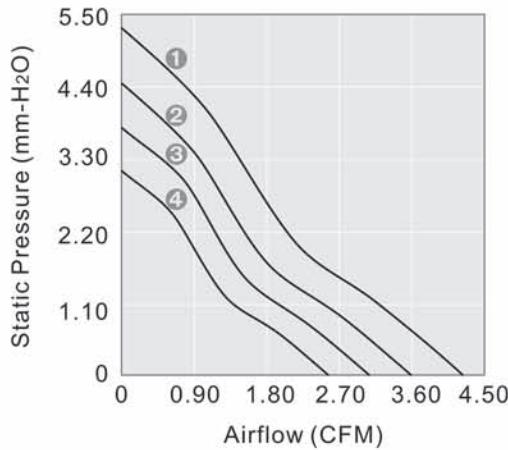

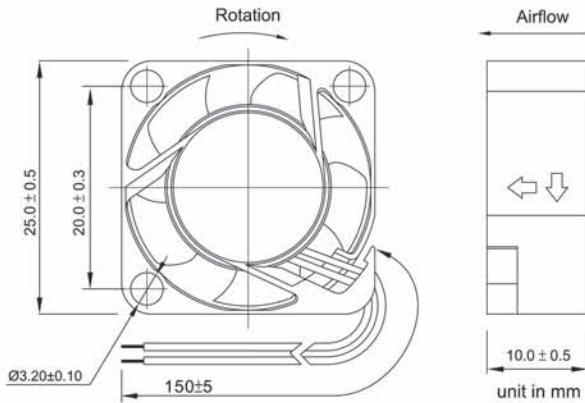

25x25x10mm

PERFORMANCE P-Q CURVE

OUTLINE DIMENSIONS

SINTETICO bearing system makes more reliable & stable

- The particular mechanism for oil leakage prevention makes proper oil film on surface of bearing and shaft to reduced damage when fan start up.
- Dynamic Pressure Field will be constructed when fan are running to sustain shaft rotate with concentricity to prevent bearing will not collided with shaft.
- Magnetic Effect makes shaft always working more smoothly to decrease Gyro Effect. That also decreases the probability of bearing collided with shaft and prevent oil film was damaged.

T.M.D. TECHNOLOGY

Advantages fo T.M.D. Technology

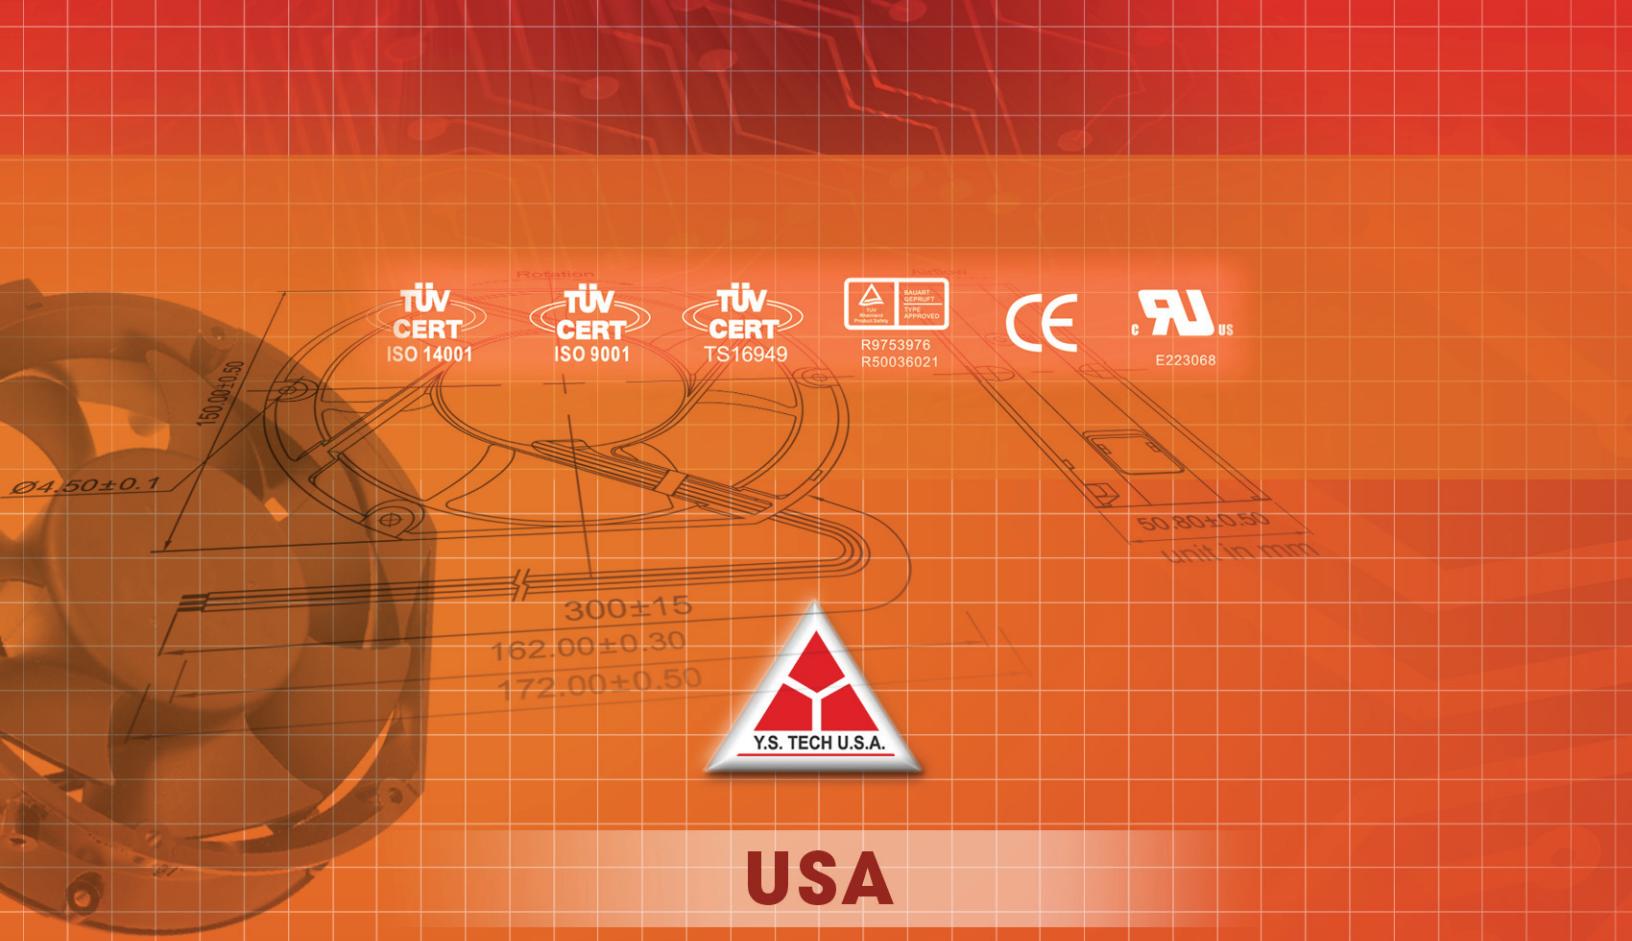

1. The patent of Tip Driving Magnetic design result in higher torque and make lower power consumption. The patent of impeller rotor with diversion ring to decrease acoustic noise that made by the flow field to fit an application of Coupling Heat Dissipation Devices.
2. External circuit design result in optimal reliability and safety when fan working in a worse ambient.
